

Remanufactured Ford 6.0L Power Stroke Fuel Injection Control Modules (FICM)

GB Remanufacturing, Inc. is pleased to announce the release of remanufactured Fuel Injection Control Modules (FICM) for the Ford 6.0L Power Stroke diesel.

The FICM controls the fuel injectors on the 6.0L engine. It is responsible for stepping up the battery voltage to 48 volts, which is required to activate the injectors. The FICM works in conjunction with the Powertrain Control Module (PCM) to control fuel delivery to the engine. The module is mounted on the engine's valve cover, a high heat and vibration prone area.

The FICM has a high failure rate on the 6.0L engine, which may cause stalling or a no-start condition. OEM replacement modules come un-programmed and must be programmed by the installer prior to vehicle operation, a difficult and costly task for the independent repair facility. GB's remanufactured FICM's are 100% torn-down, upgraded and fully tested on GB's proprietary vehicle simulator. Once fully tested the modules are pre-programmed with the appropriate vehicle software and are ready for installation and operation.

Three part numbers offer complete coverage for the F-Super Duty, E-Series vans as well as the Excursion.

GB's FICM program ensures the independent repair facility stays competitive by offering remanufactured OEM components at a fraction of the cost of new. GB also offers remanufactured injectors for the Ford 6.0L as well as the Injector Drive Module and injectors for the Ford 7.3L Power Stroke engine.
